

Pearls a-plenty

BloodSTOP™ by LifeScience PLUS — Bleeding in the patient's mouth is a common problem for us. We encounter problems with bleeding because we work in a highly vascular area. When dealing with bleeding, we need instant control.

BloodSTOP™ by LifeScience PLUS

BloodSTOP is designed to do just that! I have found that other products are harder to use and more expensive. We need something that will easily give us quick hemostasis. BloodSTOP and BloodSTOP EX hemostatic gauze are the ideal tools for general dentists and specialists (oral surgeons, periodontists, and endodontists) to control bleeding. These

products are made of hypoallergenic, natural cellulose. A fine silky gauze, it can easily be cut to fit tight intraoral spaces. On contact with blood, it turns into a gel while enhancing coagulation factors to form an active, gentle protective barrier over the wound. As BloodSTOP absorbs blood and turns into a gel, it expands to create a gentle back-pressure on the wound. It is ideal for all your patients, especially those with special problems — patients on blood thinners, smokers, hemophiliacs, and bleeders. This product is kind to patients since it is odorless and tasteless and is easily removed by irrigating with water or saline solution. Dentists are successfully using BloodSTOP hemostatic gauze to stop extreme bleeding during extractions, to prevent dry sockets, to control bleeding during an apicoectomy, and during reconstructive surgery. The product has a long shelf life (three years plus), so you don't have to worry about expiration dates. It stops bleeding 80 percent faster than traditional cotton gauze and pressure techniques. So, it really qualifies as a Pearl — faster, better, easier, and less expensive! I have been using this product for about four months now and have had truly great results. I urge you to try this product and always have it on hand. Order from your dealer, call (877) 587-5433 or visit www.life sciencesplus.com for more information.
